Chapter 16 Evolution of Populations 16-1 Genes and Variation Darwin's original ideas can now be under-stood in genetic terms. Beginning with variation, we now know that traits are con-trolled by genes and that many genes have at least two forms, or alleles. We also know that individuals of all species are heterozy-gous for many genes.

Gene expression is the process by which the genetic code – the nucleotide sequence – of a gene is used to direct protein synthesis and produce the structures of the cell. Genes that code for amino acid sequences are known as ‘structural genes’. Gene control regions: A promoter. A region a few hundred nucleotides ‘upstream’ of the gene (toward the 5’ end).
