Study Figure carefully. First, see that each atom is now surrounded by a full shell of eight valence electrons. Of the 26 valence electrons, 6 are shared, and 20 are unshared. For the six that are shared to form the covalent bonds, the phosphorus atom contributed three, and each of the chlorines contributed one.

Covalent Bonding. Covalent bonding is helpful in understanding the formation of molecules.Molecules have similar atoms such as H 2, Cl 2, O 2, N 2 are molecules of elements whereas those containing different atom like HCl, NH 3, CH 4, CO 2 are molecule of compounds. A chemical bond, which is formed by sharing of electrons between the atoms is called a covalent bond.
