Scientists have found “statistically robust evidence” that climate change drove early human species extinct. Published in the journal *One Earth* Thursday, the study combined fossil records and climate modeling for the last 5 million years in order to understand the climate preferences of early humans and how they reacted to climate changes. The period studied by the researchers covers the ...

Study Guide Section 1 Fossil Evidence Of Change Answers

The fossil evidence. By 3.5 million years ago at least one hominin species, *Au. afarensis*, was an adept walker. In addition to anatomic evidence from this time, there is also a 27.5-metre (90-foot) trackway produced by three individuals who walked at a leisurely pace on moist volcanic ash at Laetoli in northern Tanzania. In all observable features of foot shape and walking pattern, they are ...

Human evolution - The fossil evidence | Britannica

Key Points. Fossils are the preserved remains or traces of animals, plants, and other organisms from the past. Fossils are important evidence for evolution because they show that life on earth was once different from life found on earth today. Usually only a portion of an organism is preserved as a fossil, such as body fossils (bones and exoskeletons), trace fossils (feces and footprints), and chemofossils (biochemical signals).
