Pediatric and Adolescent Osteosarcoma provides a historical review of the nature of osteosarcoma and the conflict that accompanied the introduction of adjuvant therapy for osteosarcoma culminating in accepted and prevailing methods of current therapy. It outlines concepts in Epidemiology and Etiology, and provides chapters on pathology and radiologic characteristics of osteosarcoma, surgical therapy tailored specifically for treatment of primary tumors in pediatric/adolescent age group, treatment of pulmonary and extra pulmonary metastases and complications, as well as the role of radiation therapy. The volume concludes with a review of differences and similarities in the management of osteosarcoma in adults as compared to pediatrics / adolescents and new laboratory and animal investigations currently in progress to develop effective diagnostic and therapeutic approaches to improve the outcome. In essence the scope and intensive coverage of the book provides a historical perspective of the advances made over the past 30 years and emerging concepts and prospects for new diagnostic and therapeutic approaches. This is based upon past experiences and new discoveries. It also provides a unique opportunity for pediatric and adult medical oncologists, physicians in training, orthopedic surgeons, pathologists, radiologists, radiotherapists, oncology nurses and allied professionals involved in the care of pediatric/adolescent patients with osteosarcoma to become acquainted with prevailing methods of treatment

and new and evolving concepts and developments. Part of the acclaimed ACS Atlas of Clinical Oncology series, this book offers an expert overview of soft tissue sarcomas. It discusses diagnosis and staging, surgical approaches, radiation therapy, chemotherapy, pediatric sarcomas, and much more. Topics covered include epidemiology, inherited syndromes, biopsy and surgical techniques, external beam irradiation, brachytherapy, intraoperative radiation therapy, neoadjuvant therapy, adjuvant therapy, regional perfusion, pain syndromes, and rehabilitation.

Implement TMR with Your Patients and Improve Their Quality of Life Developed by Dr. Todd A. Kuiken and Dr. Gregory A. Dumanian, targeted muscle reinnervation (TMR) is a new approach to accessing motor control signals from peripheral nerves after amputation and providing sensory feedback to prosthesis users. This practical approach has many advantages over other neural-machine interfaces for the improved control of artificial limbs. Targeted Muscle Reinnervation: A Neural Interface for Artificial Limbs provides a template for the clinical implementation of TMR and a resource for further research in this new area of science. After describing the basic scientific concepts and key principles underlying TMR, the book presents surgical approaches to transhumeral and shoulder disarticulation amputations. It explores the possible role of TMR in the prevention and treatment of end-neuromas and details the principles of rehabilitation, prosthetic fitting, and occupational therapy for TMR patients. The book also describes transfer sensation and discusses the surgical and functional

outcomes of the first several TMR patients. It concludes with emerging research on using TMR to further improve the function and quality of life for people with limb loss. With contributions from renowned leaders in the field, including Drs. Kuiken and Dumanian, this book is a useful guide to implementing TMR in patients with high-level upper limb amputations. It also supplies the foundation to enable improvements in TMR techniques and advances in prosthetic technology.

The second edition of this well-received book reflects the state of the art in surgery for malignant bone tumors in children, with a particular focus on epiphysiolysis before excision. With a thorough update, new chapters, a clear presentation of tips and tricks to address complications, as well as supplementary online videos and tutorials, this book addresses the challenges of limb preservation that are posed to the surgeon in this new era of cancer treatment characterized by higher survival rates and longer survival times. The authors are experienced practitioners of Cañadell's technique, but the book also explores, thanks to the focused contributions of

experts from other fields of medicine, a range of topics from the molecular biology and histological aspects of bone tumors, to the use of imaging techniques and surgical options for epiphyseal preservation. Abundant illustrations and accounts of clinical results make this book an indispensable guide for orthopedic surgeons and pediatric oncologists and give the book an interdisciplinary appeal to practitioners in more general orthopedics, oncology, pediatrics and surgery.

Bone and soft tissue sarcomas represent only about 2% of all malignancies; however, their treatment – with the goal of curing the patient while preserving the functionality of the affected body part – can, unlike other malignancies, only be successful with therapy concepts devised by interdisciplinary teams. This volume provides an extensive up-to-date overview of the specific diagnostics and current treatment standards of these rare entities, presenting the various limb-sparing modalities for patients with bone and soft tissue sarcomas with special regard to innovative reconstructive options. The evaluation of quality of life based on validated scores and the individual methods of coping with the illness through creative artistic projects are also acknowledged and integrated in the whole concept.
