Studying the complex physical systems of stellar jets necessitates the incorporation of nonlinear effects which occur on a wide variety of length and timescales. One of the primary methods used to study the physics of jets is numerical simulations that apply high performance computing techniques. Such techniques are also required for analysing the huge modern astrophysical datasets. This book examines those computing techniques. It is a collection of the lectures from the fifth and final school of the JETSET network, "Jets From Young Stars V: High Performance Computing in Astrophysics." It begins with an introduction to parallel programming techniques, with an emphasis on Message Passing Interface (MPI), before it goes on to review grid technology techniques and offer a practical introduction to Virtual Observatory. The second half of the book, then, is devoted to applications of high performance computing techniques, including 3D radiation transfer, to jet and star formation processes. Aimed at graduate students in astrophysics, this book presents state-of-the-art methods, thereby offering interesting new insights to researchers in the field.

Virtual Crime, Is Your Computer Really Secure? Food Service Manual for Health Care Institutions John Wiley & Sons

"This publication (the text and the software) aims to explore the relationship between new technical innovations in computer technology for music and the creative practice of composers employing these new techniques. It asks: does the new technology lead to new sounds and new ways of structuring music, and if so how? What are the creative

options, sonic and structural, presented by new software and hardware? How can these be manipulated and shaped to form music? How have particular composers developed successful working methods in using this technology? To answer such questions a set of case studies have been examined in depth, specific works in which composers have adopted new techniques, whether developed by themselves or by others. Each of these works has been researched from a number of different perspectives: the technical and musical background, the technology employed in the particular work and, through music analysis, the musical outcome. Innovative approaches have been employed both in undertaking and presenting this research. On the one hand, it has been important to find appropriate ways of presenting the musical potential of what are often highly technical processes. On the other hand, it has been necessary to find ways of analyzing music that often evades even the most basic fundamentals of traditional music analysis: notes, harmonies, or instruments"--
