The study of the biology of tumours has grown to become markedly interdisciplinary, involving chemists, statisticians, epidemiologists, mathematicians, bioinformaticians, and computer scientists alongside biologists, geneticists, and clinicians. The Oxford Textbook of Cancer Biology brings together the most up-to-date developments from different branches of research into one coherent volume, providing a comprehensive and current account of this rapidly evolving field.

Structured in eight sections, the book starts with a review of the development and biology of multi-cellular organisms, how they maintain a healthy homeostasis in an individual, and a description of the molecular basis of cancer development. The book then illustrates, as once cells become neoplastic, their signalling network is altered and pathological behaviour follows. It explores the changes that cancer cells can induce in nearby normal tissue, the new relationship established between them and the stroma, and the interaction between the immune system and tumour growth. The authors illustrate the contribution provided by high throughput techniques to map cancer at different levels, from genomic sequencing to cellular metabolic functions, and how

information technology, with its vast amounts of data, is integrated with traditional cell biology to provide a global view of the disease. The effect of the different types of treatments on the biology of the neoplastic cells are explored to understand on the one side, why some treatments succeed, and on the other, how they can affect the biology of resistant and recurrent disease. The book concludes by summarizing what we know to date about cancer, and in what direction our understanding of cancer is moving. Edited by leading authorities in the field with an international team of contributors, this book is an essential resource for scholars and professionals working in the wide variety of sub-disciplines that make up today's cancer research and treatment community. It is written not only for consultation, but also for easy cover-to-cover reading.

In the late nineteenth century, David Paul von Hansemann coined phrases that have remained the basis of descriptive terms concerning the microscopical appearances of tumors ever since, yet his work is rarely mentioned today. This book presents translations of all the relevant German texts and analyses the background and context of Hansemann's theories. It shows that some of Hansemann's ideas may still be relevant to cancer research today.

This book, co-authored by an internationally

acclaimed team of experts in the field of pediatric oncologic imaging, provides a comprehensive update on new advances in diagnostic imaging as they relate to pediatric oncology. In contrast to other oncologic imaging texts focusing on the radiology of specific tumors, this book emphasizes the important fundamentals of imaging that every child with a new or treated malignancy receives. Guidance is provided on the selection and use of appropriate imaging techniques, with individual chapters devoted to each of the major cross-sectional imaging modalities used in the detection and follow-up of pediatric cancers, including PET-CT, PET-MRI, whole-body MRI, and diffusion-weighted MRI. Additional nuclear medicine techniques are addressed, and detailed attention is paid to more advanced areas of practice such as contrast-enhanced ultrasound, pediatric interventional radiology techniques, radiation treatment planning, and radiation dose considerations (ALARA). Other areas covered include screening of children with cancer predisposition syndromes, treatment related complications, potential pitfalls during neuro-oncologic imaging, and the risks and benefits inherent in post-therapy surveillance imaging. Perfect for radiation oncologists, medical physicists, and residents in both fields, Practical Radiation Oncology Physics provides a concise and practical summary of the current practice standards in

This book provides a quick reference guide for clinicians in radiation oncology. It is designed to be an intuitive and easily reviewed study guide for board or maintenance of certification examinations, as well as a quick reference for residents and established radiation oncologists who need a refresher. The text begins with a general pearls chapter that radiation oncologists should consider in all aspects of their practice, including cancer visibility, dosing, counseling recommendations, and toxicity management. The subsequent chapters then delve into different cancer disease sites, including pediatrics, central nervous system, head and neck, thoracic, breast, gastrointestinal, gynecologic, genitourinary, hematologic, soft tissue, palliative, and radiophysics/radiobiology. Within each chapter, each disease and its recommended approach is then summarized in only a few pages, allowing a focus on the most essential information. Bullet points, figures, tables, and images make for an intuitive reader experience. Recommendations are taken from the American Society for Radiation Oncology (ASTRO), the European Society for Radiation Oncology (ESTRO), and the National Comprehensive Cancer Network (NCCN). Planning guides for imaging, diagnosis, and staging offer readers a starting point in approaching each patient based on disease origin, and dosing guidelines then detail consideration for treatment methods. Each chapter additionally includes disease-specific pearls and key points to test the knowledge reviewed in the chapters. Experts in the

Residents, trainees, and established radiation oncologists find this an ideal study resource for both board and certification exams, as well as an easily accessible aid during practice.

Introduction: For patients with colorectal liver metastases (CRLM), the only treatment with a possibility for long-term survival and cure is radical resection. The majority of patients are at the time of diagnosis not assessed as resectable because they have advanced disease in the liver or unresectable extrahepatic disease or are too frail to withstand liver surgery. Patients who at the time of diagnosis are not assessed as resectable may be treated with conversion chemotherapy to downsize the tumor burden and render the patient eligible for resection. One concern with chemotherapy administered preoperatively has been the potential negative effect on the future liver remnant (FLR), especially for patients with a low volume of the FLR who are undergoing techniques to increase the volume. Established techniques to increase the volume are portal vein occlusion (PVO) and two-staged hepatectomy (TSH). A more recent method is Associating Liver Partition and Portal Vein Ligation for Staged Hepatectomy (ALPPS). Due to the relative novelty of ALPPS, the long-term oncological results are not known. For patients with CRLM, resection of liver metastases is more favorable from a health economic perspective than palliative treatment and results in a higher quality of life than palliative chemotherapy. For patients undergoing ALPPS as well as TSH, the data are scarce. **Aim:** The aim of the first study was to determine whether preoperative chemotherapy has a negative impact on the volume increase for patients undergoing ALPPS. The aim of the second study was to

analyze the temporal course of the volume increase in the FLR for patients undergoing PVO. The aim of the third study was to study the long-term outcome for patients randomized to ALPPS or TSH. The aim of the fourth study was to perform a health economic analysis of patients randomized to ALPPS or TSH. Methods: The first study was based on data from the ALPPS registry, which is an international registry initiated 2012. All patients included in the registry between 2012 and 2016 were included. The patients were divided into the following four groups: no preoperative chemotherapy, 1 regimen of neoadjuvant chemotherapy, more than 1 regimen, and more than 1 regimen with the addition of monoclonal antibodies. The volume increase between interventions 1 and 2 was analyzed. In the second study, a retrospective analysis was performed of patients randomized to TSH. Forty-eight patients were included. The volume increase of the FLR was analyzed as the kinetic growth rate (KGR). The KGR was calculated from PVO until radical hepatectomy or exclusion, as well as between the first and second radiological evaluations. In the third and fourth studies, patients randomized to ALPPS and TSH were included. In the third study, survival, as well as factors affecting the outcome, were analyzed. In the fourth study, a calculation of resource use was performed, as was an analysis of health-related quality of life (HRQoL) for the groups. Results: In the first study, it was found that chemotherapy had no negative impact on the volume increase for patients undergoing ALPPS. In the second study, it was found that the volume increase of the FLR was largest the first week after ALPPS. In the third study, it was found that patients randomized to ALPPS had a longer survival than those randomized to TSH. Of the factors affecting the outcome, resection of liver metastases had a significant impact. In the fourth study, no significant difference could be found in resource use or HRQoL for patients

randomized to ALPPS over TSH. Conclusion: Patients with advanced CRLM undergoing ALPPS should receive preoperative chemotherapy, if indicated. For those undergoing PVO, early evaluation is crucial to evaluate the volume increase, and for those with insufficient increase, additional techniques to increase the volume should be considered. Resection of liver metastases is an important factor to improve the outcome. Further studies are warranted to conclude whether ALPPS or TSH is most effective from a health economic perspective.

The topic is approached from a psycho-oncology perspective, i.e. placing the emotional, behavioural and social elements at the centre of the topics covered in the chapters. The aim is to describe approaches and treatments that can be utilised by cancer clinicians, mental health professionals, psycho-oncologists in training and allied psychosocial oncology professionals. It emphasises the importance of multidisciplinary care.

The dissection of surgical specimens from the upper aero digestive tract is often difficult due to the anatomically complicated nature of this area. Local environment dictates routes of tumour spread and surgical margins at risk and these features differ for various subsites within this part of the body. Moreover, adequate investigation of surgical specimens of the upper aero digestive tract requires knowledge of the various types of surgical procedures used for different areas and should provide data that enable the surgeon to correlate preoperatively performed diagnostic imaging with the macroscopic findings obtained postoperatively. The aim of this book is to provide guidelines for the anatomical dissection of specimens from oral and sinonasal cavities, pharynx and larynx. This is done by illustrations that combine drawings of tumours at various anatomical subsites, details of the respective surgical procedures, the specimens thus obtained, and the way to dissect these specimens as shown by colour photographs of surgical specimens

guided and intensity-modulated radiation therapy is clearly described, and careful attention is also devoted to the roles of proton therapy, stereotactic radiosurgery, stereotactic fractionated radiosurgery, and modulated arc radiotherapy. Separate chapters address localization and verification procedures and anesthesia; pediatric radiation oncology in the palliative care setting; and aspects that are especially relevant in low- and medium-income countries. Beyond clinical radiation oncology, relevant information is provided on radiation physics. The book concludes by examining future directions in the field.
