Salient Features of the Book: Simple and lucid language Sequential arrangement of topics Review question after each chapter Interest calculation table Straight answers to 101 nagging questions

The Empress Zoe, ruthless and cruel, rules the eastern Mediterranean. To fight her battles, she employs an army of Vikings - the most fearsome warriors of their time. Led by the legendary Harald Hardrada, these mercenaries will do whatever it takes to win. Hiding in their ranks is Solveig - a fifteen-year-old girl. Amid the excitement and danger of combat, she must face terrible truths about the brutality of her people - and of her father. And, in the end, she will have to choose between all she holds dear, and what she believes is right. An epic adventure about Vikings and Saracens, ship battles and land-raids, loyalty and sacrifice.

The Eighth Edition of the standard engineering economy text and reference explains the principles and techniques needed for making decisions about the acquisition and retirement of capital goods by industry and government, as well as alternative types of financing and other applications. Arranged in four parts: basic concepts, principles, and mathematics; procedures and methods for evaluating alternatives; techniques for handling special situations; and special applications. Introduces the use of computers and spreadsheets in evaluating engineering alternatives. Includes up-to-date coverage of federal tax legislation, extensive discussions and problems dealing with personal finance, and material on handling multiple alternatives by rate of return and benefit/cost ratio methods. Contains numerous examples and 476 problems, many entirely new. Accompanied by a complete solutions manual for the instructor.

This work examines the most important techniques for analyzing the profitability of capital investments. It discusses time value mechanics and financial concepts, including discounted cash flow, return on investment, incremental analysis, cash flow tables, income taxes, depreciation, cost of capital and risk analysis. It provides a broad introduction to project evaluation and data needs.;This book is intended for: cost, project, design, mechanical, chemical, industrial,electronic,electrical and construction engineers; project and budget managers; cost estimators and controllers; planners and schedulers; and upper-level undergraduate and graduate students in these disciplines.

We no longer build buildings like we used to nor do we pay for them in the same way. Buildings today are no longer only shelter but are also life support systems, communication terminals, data manufacturing centers, and much more.

Buildings are incredibly expensive tools that must be constantly adjusted to function efficiently. The economics of building has become as complex as its design. When buildings were shelter they lasted longer than their builders. The average gothic master mason lived 35 or 40 years. Cathedrals took 3 or 4 hundred years to build. Cost estimates were verified by

great great grandchildren of the original designer. Today, creative economics has become as important as creative design and creative building. The client brings builder, contractor, architect, and facilities manager to account in their life time. The cost of building can therefore no longer be left to chance or act of god. Solutions are no longer as ingeniously simple as those proposed by a Florentine builder early in the 15th century. He proposed to center the dome of S. Maria del Fiore on a great mound of earth mixed with pennies. When the job was done street urchins would carry away the dirt in their search for the pennies. This was a serious suggestion offered by an early construction manager before Brunelleschi solved the problem more sensibly.

Offers instruction in manufacturing engineering management strategies to help the student optimize future manufacturing processes and procedures. This edition includes innovations that have changed management's approach toward the uses of manufacturing engineering within the business continuum.

This is a print on demand edition of a hard to find publication. Analyzes the factors that determine the cost of electricity from new power plants. These factors -- including construction costs, fuel expense, environ. regulations, and financing costs -- can all be affected by government, energy, environmental, and economic policies. Contents: (1) Intro. and Org.; (2) Types of Generating Technologies: Electricity Demand and Power Plant Choice and Operation; Utility Scale Generating Technologies; (3) Factors that Drive Power Plant Costs; (4) Fuel Costs. Appendixes: Power Generation Technology Process Diagrams and Images; Estimates of Power Plant Overnight Costs; Estimates of Technology Costs and Efficiency with Carbon Capture; Financial and Operating Assumptions. Charts and tables.

Includes Part 1A: Books and Part 1B: Pamphlets, Serials and Contributions to Periodicals

Choosing By Advantages is a set of concepts and methods designed to make decisionmaking more effective for organizations, communities, and individuals. The system is particularly useful for strategic planners, engineers, consultants, and managers, though anyone, from families to the largest firms, will find the concepts valuable and simple to follow.
