

Resources Values And Development

Water is a finite and non-substitutable resource. As the foundation of life, societies and economies, it carries multiple values and benefits. But unlike most other natural resources, it has proven extremely difficult to determine its true 'value'. The 2021 edition of the United Nations World Water Development Report, titled "Valuing Water" assesses the current status of and challenges to the valuation of water across different sectors and perspectives and identifies ways in which valuation can be promoted as a tool to help improve its management and achieve global sustainable development.

Originally published in 1974 *Values and Moral Development in Higher Education* deals practically with various aspects of the impact of higher educational processes, recognising a need for these to be inter-related and understood within a common framework. It takes the form of a set of contributions whose authors have sought to relate their perspectives and experiences by reference to John Wilson's philosophical analyses of the nature of moral maturity and the possible aims of moral education, and, where possible, to each other.

Policy-makers are increasingly trying to assign economic values to areas such as ecologies, the atmosphere, even human lives. These new values, assigned to

areas previously considered outside of economic systems, often act to qualify, alter or replace former non-pecuniary values. *Valuing Development, Environment and Conservation* looks to explore the complex interdependencies, contradictions and trade-offs that can take place between economic values and the social, environmental, political and ethical systems that inform non-monetary valuation processes. Using rich empirical material, the book explores the processes of valuation, their components, calculative technologies, and outcomes in different social, ecological and conservation domains. The book gives reasons for why economic calculation tends to dominate in practice, but also presents new insights on how the disobedient materiality of things and the ingenuity of human and non-human agencies can combine and frustrate the dominant economic models within calculative processes. This book highlights the tension between, on the one hand, a dominant model that emphasises technical and 'universalising' criteria, and on the other hand, valuation practice in specific local contexts which is more likely to negotiate criteria that are plural, incommensurable and political. This book is perfect for researchers and students within development studies, environment, geography, politics, sociology and anthropology who are looking for new insights into how processes of valuation take place in the 21st century, and with what consequential outcomes.

To enhance sustainable development research and practice the values of the researchers, project managers and participants must first be made explicit. Values in Sustainable Development introduces and compares worldviews and values from multiple countries and perspectives, providing a survey of empirical methods available to study environmental values as affected by sustainable development. The first part is methodological, looking at what values are, why they are important, and how to include values in sustainable development. The second part looks at how values differ across social contexts, religions and viewpoints demonstrating how various individuals may value nature from a variety of cultural, social, and religious points of view. The third and final part presents case studies ordered by scale from the individual and community levels through to the national, regional and international levels. These examples show how values can motivate, be incorporated into and be an integral part of the success of a project. This thought-provoking book gives researchers, students and practitioners in sustainable development a wealth of approaches to include values in their research.

This book provides a comprehensive review of environmental benefit transfer methods, issues and challenges, covering topics relevant to researchers and practitioners. Early chapters provide accessible introductory materials suitable for

non-economists. These chapters also detail how benefit transfer is used within the policy process. Later chapters cover more advanced topics suited to valuation researchers, graduate students and those with similar knowledge of economic and statistical theory and methods. This book provides the most complete coverage of environmental benefit transfer methods available in a single location. The book targets a wide audience, including undergraduate and graduate students, practitioners in economics and other disciplines looking for a one-stop handbook covering benefit transfer topics and those who wish to apply or evaluate benefit transfer methods. It is designed for those both with and without training in economics

Non-market valuation is becoming increasingly accepted as an evaluative tool of economics related to environmental and resource protection. Freeman (economics, Bowdoin College) presents an overview of the literature, introducing the principal methods and techniques of resource valuation. Chapters cover the measurement of welfare changes, revealed and stated preference models, nonuse models, aggregation of values across time, environmental quality as factor input, longevity and health valuation, property value models, hedonic wage models, and recreational uses of natural resource systems. capital. This book seeks to extend this theory into what have been largely under-investigated domains, and, at the same time, address long-standing, classic questions in the literature concerning the forms, determinants, and consequences of social capital. Social capital can be understood in terms of social norms and networks. It manifests itself in patterns of trust, reciprocity, and cooperation. The authors argue that the degree to which and the different ways in which people exhibit these distinctively social behaviours depend on how norms and networks elicit their values, reflect power relationships, and draw on their social identities. This volume accordingly adopts a variety of different concepts and measures that incorporate the variety of contextually-specific factors that operate on social capital formation. In addition, it adopts an interdisciplinary outlook that combines a wide range of social science disciplines and methods of social research. Our objective is to challenge standard rationality theory explanations of norms and networks which overlook the role of values, power, and identity. This volume appeals to researchers and students in multiple social sciences, including economics, sociology, political science, social psychology, history, public policy, and international relations, that employ social capital concepts and methods in their research. It can be seen as a set of new extensions of social capital theory in connection with its themes of social values, power, and identity that would advance the scholarly literature on social norms and networks and their impact on social change and public welfare.

brilliant Richard Barrett has accumulated over decades of path-breaking work. If every individual and organisation used Richard's frameworks to guide their actions, our world would be a blessed place. Raj Sisodia, FW Olin Distinguished Professor of Global Business, Babson College, Co-founder & Chairman Emeritus, Conscious Capitalism Inc., USA. The best book on values I have ever read. Richard Barrett is one of the world's foremost experts on the subject; nevertheless he manages to inhabit the 'beginner's mind': He takes us back to the fundamental truths about the importance of values in our personal, organisational and societal lives. Increasingly in the public discourse there are references to the knowledge economy, knowledge society, knowledge workers and knowledge organisations. The argument is that knowledge is becoming the main economic resource, replacing the natural resources that drove the industrial revolution. The new knowledge economy is driven by knowledge development, innovation and highly skilled employees. Increasing investment in higher education and in universities is in line with this strategy and understanding. In an earlier book, *Creating Collaborative Advantage* edited with Richard Ennals, Professor Hans Christian Garmann Johnsen argued that it is knowledge that links social and economic processes. He believes that what is missing in the current discussion on innovation is a conceptualisation of exactly what knowledge is. In *The New Natural Resource*, he digs deeper into what it is and how it develops and subsequently leads to widespread change. The author argues that knowledge is inherently a social phenomenon. That is why social processes are closely linked to economic development, and why this relationship becomes even more apparent in the new knowledge economy. Knowledge is not an objective entity, established once and for all.

Knowledge development is interrelated with values, norms, perceptions and interpretations. We need to know what the mechanisms are by which knowledge becomes legitimate, true and relevant.

This new edition incorporates revised guidance from H.M Treasury which is designed to promote efficient policy development and resource allocation across government through the use of a thorough, long-term and analytically robust approach to the appraisal and evaluation of public service projects before significant funds are committed. It is the first edition to have been aided by a consultation process in order to ensure the guidance is clearer and more closely tailored to suit the needs of users.

Development has been on Africa's agenda for a long time but progress has been both varied and limited, partly due to the diverse level of the discussions on the challenges and the interventions for tackling them. Africa's greatest challenge is the uneven development within and between its countries, and the pressing issues of extreme poverty in southern Africa, and the continent as a whole. Poverty causes its victims to suffer social exclusion and political repression. In addition, societies that experience poverty are also mostly under continuous threat of ecological disasters and diseases. All poor people are therefore plagued by loss of freedom and dignity, and are often unable to participate effectively in the political, economic, legal and social processes of their countries. This book focuses on the social and cultural dimensions of development dynamics and, in particular, the role of values in shaping

development. Values are at the core of the hopes and aspirations of individuals, communities and societies. The book therefore explains the values that motivate and inform African communities and societies, with a view to facilitating a dialogue about sustainable development in Africa among academics, intellectuals, policy and decisionmakers, and the communities. It also investigates the social and cultural dynamics of development in Africa, as a better alternative to earlier studies that blame African culture for poverty and exclude the people of Africa in their definition of developments in the continent. The significance of this book lies in its provision of a theoretical argument, from empirical perspective, on the role of values in the development of Africa; an argument that is capable of facilitating a dialogue about African development, which obviously proves more useful than either the imposition of a technical process or the announcement of a normative framework.

This author calls for an end to excessive consumption by individuals and corporations and, at the same time, calls for an economy based on the needs of people, not businesses.

Human Resources and their Development is a component of Encyclopedia of Human Resources Policy, Development and Management in the global Encyclopedia of Life Support Systems (EOLSS), which is an integrated compendium of twenty one Encyclopedias. The Theme on Human Resources and their Development provides the essential aspects and a myriad of issues of great relevance to our world such as: Human Resources and their Development; Major Issues in Human Resource Development; Elements of Planning Strategies for Human Resource Development; Human Life Systems, Diversity and Human Development; Human Development and Causes of Global Change; Consequences of Global Change for Human Resource Development. This first report deals with some of the major development issues confronting the developing countries and explores the relationship of the major trends in the international economy to them. It is designed to help clarify some of the linkages between the international economy and domestic strategies in the developing countries against the background of growing interdependence and increasing complexity in the world economy. It assesses the prospects for progress in accelerating growth and alleviating poverty, and identifies some of the major policy issues which will affect these prospects.

Kenneth Arrow's pathbreaking "impossibility theorem" was a watershed in the history of welfare economics, voting theory, and collective choice, demonstrating that there is no voting rule that satisfies the four desirable axioms of decisiveness, consensus, nondictatorship, and independence. In this book, Amartya Sen and Eric Maskin explore the implications of Arrow's theorem. Sen considers its ongoing utility, exploring the theorem's value and limitations in relation to recent research on social reasoning, while Maskin discusses how to design a voting rule that gets us closer to the ideal—given that achieving the ideal is impossible. The volume also contains a contextual introduction by social choice scholar Prasanta K. Pattanaik and

commentaries from Joseph E. Stiglitz and Kenneth Arrow himself, as well as essays by Sen and Maskin outlining the mathematical proof and framework behind their assertions.
