This volume serves as the post-conference proceedings for the Second GeoSensor Networks Conference that was held in Boston, Massachusetts in October 2006. The conference addressed issues related to the collection, management, processing, analysis, and delivery of real-time geospatial data using distributed geosensor networks. This represents an evolution of the traditional static and centralized geocomputational paradigm, to support the collection of both temporally and spatially high-resolution, up-to-date data over a broad geographic area, and to use sensor networks as actuators in geographic space. Sensors in these environments can be static or mobile, and can be used to passively collect information about the environment or, eventually, to actively influence it. The research challenges behind this novel paradigm extend the frontiers of traditional GIS research further into computer science, addressing issues like data stream processing, mobile computing, location-based services, temporal-spatial queries over geosensor networks, adaptable middleware, sensor data integration and mining, automated updating of geospatial databases, VR modeling, and computer vision. In order to address these topics, the GSN 2006 conference brought together leading experts in these fields, and provided a three-day forum to present papers and exchange ideas.

Land Management is normally embedded in a complex legal context, which frequently consists of contradictory objectives, such as: strengthening of rural areas, satisfying the need for affordable living and commercial space, protecting environment and health, supporting transport infrastructure development, and preserving the landscape. Land management can be understood as a process that comprises coordination of such activities while managing the use and the development of land resources. It can be constrained by the land use specifications resulting from spatial planning process. Along with this, the legal framework often contains generally formulated concepts and open standards, which provide a range of opportunities for realization while balancing the different interests. In this process it is important if and how both constraints and opportunities are recognised by the actors. In this volume this topic is examined from various aspects: first the problems in promoting mutual understanding between researchers and the general public, but also among scientists of different disciplines; second the success requirements of land management instruments as well as unfortunate experience caused by land use changes; third covering land management costs by absorbing value increase and other trade off aspects; and fourth supporting land management by providing geodata with low-cost methods.

With a seemingly endless amount of marketing dollars at their disposal, Samsung has long been the reigning king of Android. Nobody else comes close on a global scale. This isn't so much because Samsung has always built the best-looking devices, or even developed the most intuitive software. It's because Samsung discovered early on that if they threw enough ad dollars into something, it would guarantee success. And for the most part, they were right. But as we saw with last year's Samsung Galaxy S5, it was clear people were wising up. The device failed to resonate with consumers and in the end, failed to meet Samsung's lofty sales goals. Sure it had lots of "me too" features (fingerprint reader, heart rate sensor, loads of software enhancements), but it was a jack of all trades and master of none. With the Samsung Galaxy S6 and Samsung Galaxy S6 Edge, Samsung has finally seen the error of their ways. The new handsets aren't so much a deviation from Samsung's traditional Galaxy line as they are a very necessary evolution. The good kind. But is it all roses?
