Biological oxidation is an energy-producing reaction in living cells, and it is coupled with a reduction reaction . When a compound loses an electron, or is oxidized, another compound gains the electron, or is reduced. Oxidation-reduction (redox) reactions represent the main source of biological energy.

We have employed $^{16}\text{O}(\alpha,\alpha)$ ^{16}O oxygen resonance measurement and transmission electron microscopy to study the oxidation and reduction of copper oxide thin films. The in- and out-diffusion of oxygen-induced oxygen concentration variations and microstructural changes in the films were monitored. The study of reduction was carried out by annealing CuO and Cu_4O_3 thin films in vacuum.

The fact that a proton (the hydrogen nucleus) is also transferred is immaterial to whether we consider a reaction oxidation or reduction. Table 2.5 summarizes these energy transfer reactions. We can symbolize oxidation and reduction as follows, letting A and B symbolize arbitrary molecules and e^- represent one or more electrons:

A mechanism for electron transfer reactions is described, in which there is very little spatial overlap of the electronic orbitals of the two reacting molecules in the activated complex. Assuming such a mechanism, a quantitative theory of the rates of oxidation-reduction reactions involving electron transfer in solution is presented. The assumption of "slight-overlap" is shown to lead to ...
