An aldol condensation is a condensation reaction in organic chemistry in which an enol or an enolate ion reacts with a carbonyl compound to form a β -hydroxyaldehyde or β -hydroxyketone (an aldol reaction), followed by dehydration to give a conjugated enone. Aldol condensations are important in organic synthesis and biochemistry as ways to form carbon-carbon bonds. In its usual form, it ...

The activity of the adsorbent is represented by its activity grade, which is a measure of an adsorbent's attraction for solutes in the sample solution. The solids with the highest activity grading are those that are completely anhydrous. Silica gel and alumina are among the most popular adsorbents used. Alumina caters well to samples that that require specific conditions to adequately separate ...

Aromatic Rings. Aromatic rings (also known as aromatic compounds or arenes) are hydrocarbons which contain benzene, or some other related ring structure.Benzene, C 6 H 6, is often drawn as a ring of six carbon atoms, with alternating double bonds and single bonds. This simple picture has some complications, however. (Everything in organic chemistry has complications!)
