Solving Equations And Inequalities Review

Solving Equations and Inequalities. An equation consists of two mathematical expressions separated by an equals sign. For instance: $1 + 1 = 2$. Any operations can be performed the same way on both sides of the equation and yield the same result. Inequalities consist of two mathematical expressions separated by a sign indicated which side is greater or lesser. For example: $1 < 2$.

Solving Linear Inequalities in One Variable You solve linear inequalities just like equations, except if you multiply or divide by a negative when solving for the variable, you must reverse the inequality symbol. The solutions to linear inequalities can be expressed several ways: using inequalities, using a graph, or using interval notation. Example: Solve.

Chapter 2 Solving Inequalities Quiz Review

Solving inequalities by multiplying or dividing uses the same identity properties as equations with one important difference. If the number to be multiplied or divided is positive, then the direction of the inequality stays the same. However, if the number to be multiplied or divided is negative, the direction of the inequality is reversed.
