In addition to fundamental ideas, the authors discuss topics in modern time series analysis such as modern regression, long memory, GARCH, and MCMC. I found the material easy to read and I thought the problems were at an appropriate level. I found most texts on time series to be either theory oriented or watered down and simple.

Time Series Analysis and Its Applicability Time Series analysis is "an ordered sequence of values of a variable at equally spaced time intervals." It is used to understand the determining factors and structure behind the observed data, choose a model to forecast, thereby leading to better decision making.

Mathematical Model for Time Series Analysis. Mathematically, a time series is given as. $y_t = f(t)$ Here, y_t is the value of the variable under study at time t . If the population is the variable under study at the various time period $t_1, t_2, t_3, \dots, t_n$. Then the time series is: $t: t_1, t_2, t_3, \dots, t_n$. $y_t: y_{t_1}, y_{t_2}, y_{t_3}, \dots, y_{t_n}$. or, $t: t_1, t_2, t_3, \dots, t_n$

A time series is a series of data points indexed (or listed or graphed) in time order. Most commonly, a time series is a sequence taken at successive equally spaced points in time. Thus it is a sequence of discrete-time data. Examples of time series are heights of ocean tides, counts of sunspots, and the daily closing value of the Dow Jones Industrial Average.
